## Abstract

This is my notes of the course “Dynamical Systems and Ergodic Theory” given by Manfred Einsiedler.

## 0 Examples

Let  $X$  be a set and  $T: X \rightarrow X$  be a map.

**Definition 0.1.** *fixed point, periodic point, period, orbit...*

**Definition 0.2.** *Assume  $X$  has a topology. The  $\omega$ -limit of  $x \in X$  is*

$$\omega^\pm(x) := \left\{ \lim_{k \rightarrow \infty} T^{n_k} x : n_k \nearrow \pm\infty \right\}.$$

We could also ask about the “distribution” of  $x, Tx, T^2x, \dots, T^n x$  inside  $X$  as  $n \rightarrow \infty$ .

More generally, a dynamical system can be defined as a group action.

**Example 0.3.**  $X = \mathbb{R}$ ,  $Tx = x + 1$ . The  $\omega$ -limits are empty set. Thus we will restrict to compact metric spaces.

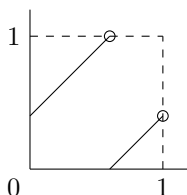

**Example 0.4.**  $X = \mathbb{R} \cup \{\infty\}$  the one-point compactification of  $\mathbb{R}$ .  $T(x) = \begin{cases} x + 1, & x \in \mathbb{R}; \\ \infty, & x = \infty \end{cases}$ . Then the  $\omega$ -limits are all  $\{\infty\}$ .

**Example 0.5.**  $X = \mathbb{R} \cup \{\pm\infty\}$ .  $T(x) = \begin{cases} x + 1, & x \in \mathbb{R}; \\ +\infty, & x = +\infty; \\ -\infty, & x = -\infty \end{cases}$ . Then  $\omega^+(x) = \begin{cases} +\infty, & x \in \mathbb{R} \cup \{+\infty\}; \\ -\infty, & x = -\infty \end{cases}$ .

**Example 0.6.** North-South Dynamics

**Example 0.7.**  $X = \mathbb{T} = \mathbb{R}/\mathbb{Z} \cong \mathbb{S}^1$  with the metric  $d(x + \mathbb{Z}, y + \mathbb{Z}) = \min_{k \in \mathbb{Z}} |x - y + k|$ .  $R(x + \mathbb{Z}) := x + \alpha + \mathbb{Z}$  for a fixed  $\alpha \in \mathbb{T}$ .  $R: \mathbb{T} \rightarrow \mathbb{T}$  is an isometry.

- If  $\alpha = \frac{p}{q}$  is rational, then  $R^q(x + \mathbb{Z}) = x + q\alpha + \mathbb{Z} = x + p + \mathbb{Z} = x + \mathbb{Z}$ . Every point is periodic with period  $q$ .

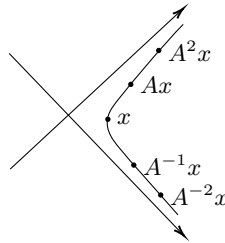

- If  $\alpha \notin \mathbb{Q}/\mathbb{Z}$ , then no point is periodic: say  $R^n(x + \mathbb{Z}) = x + \mathbb{Z}$ , then  $n\alpha \in \mathbb{Z}$ . Actually, all orbits are dense in this case.

**Example 0.8.**  $X = \mathbb{T} = \mathbb{R}/\mathbb{Z}$ . Fix  $p \geq 2 \in \mathbb{N}$ .  $T(x) := px$ . This map links to the base- $p$  expansion of  $x \in [0, 1)$ . Suppose  $x = \sum_{k=1}^{\infty} \theta_k p^{-k}$  where  $\theta_k \in \{0, \dots, p-1\}$ . Then  $Tx = p \sum_{k=1}^{\infty} \theta_k p^{-k} + \mathbb{Z} = \sum_{k=1}^{\infty} \theta_{k+1} p^{-k} + \mathbb{Z}$ .

**Claim.** • There exist lots of periodic points— they are dense.

- There exist pre-periodic points that are not periodic, where  $x$  is pre-periodic if its orbit  $|\mathcal{O}^+(x)| < \infty$ .
- Many periods exist.
- The set of pre-periodic points is countable.
- There exist  $x \in \mathbb{T}$  with  $\omega^+(x) = \mathbb{T}$ .
- There exist  $x \in \mathbb{T}$  with  $\omega^+(x)$  uncountable but not  $\mathbb{T}$ .
- There exist  $x \in \mathbb{T}$  with  $\omega^+(x)$  countable but not finite.

**Example 0.9.**  $X = \mathbb{T}^2 = \mathbb{R}^2/\mathbb{Z}^2$ ,  $A = \begin{pmatrix} 0 & 1 \\ 1 & 1 \end{pmatrix}$ . This is called a hyperbolic toral automorphism, because the orbit of any  $x \neq 0 \in X$  is on a hyperbola.

**Example 0.10.**  $X = (0, 1) - \mathbb{Q}$ ,  $Tx = \frac{1}{x} - \left\lfloor \frac{1}{x} \right\rfloor$ . This relates to continued fraction expansion

$$x = \frac{1}{a_1 + \frac{1}{a_2 + \frac{1}{a_3 + \dots}}}$$

where  $a_1, a_2, a_3, \dots \in \mathbb{N}$ . Note that

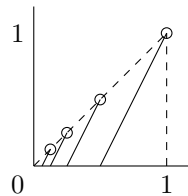

$$Tx = \frac{1}{a_2 + \frac{1}{a_3 + \frac{1}{a_4 + \dots}}}$$

**Example 0.11** (Benford's law for powers of 2). Given  $j \in \{1, \dots, 9\}$ , the limits

$$d_j := \lim_{N \rightarrow \infty} \frac{1}{N} \# \{2^n : 1 \leq n \leq N, 2^n \text{ starts in digital expansion with } j\}$$

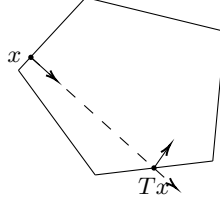

satisfy  $d_1 > d_2 > \dots > d_9 > 0$ . In fact  $d_1 = \log_{10} 2$ .

**Example 0.12.**  $X = [0, 1]$ ,  $T(x) = \begin{cases} 0, & x = 0, 1; \\ nx - 1, & x \in \left[\frac{1}{n}, \frac{1}{n-1}\right) \end{cases}$ .

We claim that  $\lim_{n \rightarrow \infty} T^n x = 0$ , and if  $x \in \mathbb{Q}$ , there exists  $n$  with  $T^n x = 0$  and if  $x \notin \mathbb{Q}$ ,  $T^n x > 0$  for all  $n$ . For  $x = e$  this can be used to show that  $e \notin \mathbb{Q}$ .

**Example 0.13** (Billiards).  $X$  is the set of boundary points with a vector and  $T$  is the movement of a boundary point along its vector to the next boundary point with a reflected vector.

Given a triangle, are there always periodic points? When the triangle is acute, right or obtuse with rational angles, the answer is yes. For the other cases, people don't know.

**Example 0.14** (Geodesic flow). Given a nice manifold  $M$  and its unit tangent bundle. There exists a way of following any vector in the tangent. When  $M$  is a sphere, the orbits are great circles. When  $M$  is a torus, whether an orbit is closed depending on whether the initial vector is rational. When  $M$  is a orientable surface of genus greater than 2, the orbits will be more complicated and more sensitive to initial values.

## 1 Topological Dynamics

Assume  $X$  is a compact metric space and  $T: X \rightarrow X$  is continuous or even a homeomorphism.

**Definition 1.1.** A homeomorphism  $T: X \rightarrow X$  is called (topological) transitive if there exists a point  $x_0 \in X$  for which the orbit is dense, i.e.  $\overline{\mathcal{O}(x_0)} = X$ .

**Definition 1.2.** A continuous map  $T: X \rightarrow X$  is called forward transitive if there exists  $x_0 \in X$  with  $\overline{\mathcal{O}^+(x_0)} = X$ .

**Example 1.3.**  $T_p: \mathbb{T} \rightarrow \mathbb{T}$  for  $p \geq 2$  an integer which maps  $x$  to  $px$  is forward transitive. We will construct  $x_0$  using base- $p$ -expansion. We first list all finite sequences in the symbols  $0, 1, \dots, p-1$ , and consider the result as one sequence of digits  $a_1, a_2, \dots \in \{0, 1, \dots, p-1\}$ . Then we define  $x_0 := \sum_{k=1}^{\infty} a_k p^{-k}$ . For any  $\left[\frac{j}{p^i}, \frac{j+1}{p^i}\right)$ , we can find an  $l$  such that  $T^l x_0$  is in this interval. Thus  $\mathcal{O}^+(x_0)$  is dense in  $\mathbb{T}$ . For example, for  $p = 2$ , we write

$$0, 1, 00, 01, 10, 000, \dots, 111, 0000, \dots, 1111, \dots$$

Then we write it as a number sequence

$$0, 1, 0, 0, 0, 1, 1, 0, 0, 0, 0, \dots, 1, 1, 1, 0, 0, 0, 0, \dots, 1, 1, 1, 1, \dots$$

and then

$$x_0 = 0 \cdot \frac{1}{2} + 1 \cdot \frac{1}{4} + 0 \cdot \frac{1}{8} + 0 \cdot \frac{1}{16} + 0 \cdot \frac{1}{32} + 1 \cdot \frac{1}{32} + 1 \cdot \frac{1}{64} + \dots$$

When we apply  $T$  on  $x_0$  for  $n$  times, the first  $n$  numbers of the number sequence will become 0. Then for any  $\frac{j+1}{2^i}$ , we can find an  $n$  such that the base-2-expansion of  $\frac{j+1}{2^i}$  will at the start of the number sequence. This means  $T^n x_0 \in \left[\frac{j}{2^i}, \frac{j+1}{2^i}\right)$ .

**Example 1.4.**  $R_\alpha: \mathbb{T} \rightarrow \mathbb{T}$  maps  $x$  to  $x + \alpha$ .

- If  $\alpha \in \mathbb{Q}/\mathbb{Z}$ ,  $R_\alpha$  only has periodic orbits and so is not transitive.
- If  $\alpha \notin \mathbb{Q}/\mathbb{Z}$ ,  $R_\alpha$  is topological transitive. See later.

**Proposition 1.5.** Let  $T: X \rightarrow X$  be a homeomorphism. The followings are equivalent:

1.  $T$  is topological transitive;
2. if  $U \subset X$  is open and  $TU = U$ , then either  $U = \emptyset$  or  $\overline{U} = X$ ;
3. if  $U, V \subset X$  are non-empty and open, then there exists  $n \in \mathbb{Z}$  so that  $T^n U \cap V \neq \emptyset$ ;
4. the set  $\{x_0 \in X : \overline{\mathcal{O}(x_0)} = X\}$  is a dense  $G_\delta$ -set.

**Definition 1.6.** A set  $G$  is called a  $G_\delta$ -set if it is a countable intersection of open sets.

**Theorem 1.7** (Baire Category Theorem). *Let  $X$  be a complete metric space. Let  $O_n \subset X$  be a sequence of dense open sets. Then  $\bigcap_{n=1}^{\infty} O_n$  is a dense  $G_\delta$ -set.*

*Proof.* We only prove that  $\bigcup_{n=1}^{\infty} O_n$  is dense. For any open set  $U$ , we want to find a point in  $U \cap \bigcup_{n=1}^{\infty} O_n$ . First,  $U \cap O_1$  is non-empty and open because  $O_1$  is open and dense. Then we can find a open ball  $B_{\varepsilon_1}(x_1) \subset U \cap O_1$ . Repeat this process. We find a open ball  $B_{\varepsilon_2}(x_2) \subset B_{\varepsilon_1}(x_1) \cap O_2 \dots$  WLOG we can suppose  $\varepsilon_n \leq \frac{1}{n}$ . Thus we can claim that  $\{x_n\}$  is a Cauchy sequence and  $x := \lim_{n \rightarrow \infty} x_n \in U \cap \bigcap_{n=1}^{\infty} O_n$ : by construction,  $x_m \in B_{\varepsilon_{m-1}}(x_{m-1}) \subset \dots \subset B_{\varepsilon_n}(x_n)$  and then  $d(x_m, x_n) < \varepsilon_n \leq \frac{1}{n}$ . Note that  $X$  is complete, the limit  $x = \lim_{n \rightarrow \infty} x_n \in X$  exists. For all  $n$ , taking the limit of  $m$ , we obtain  $x = \lim_{m \rightarrow \infty} x_m \in \overline{B_{\varepsilon_n}(x_n)} \subset O_n$ . Moreover,  $x \in \overline{B_{\varepsilon_1}(x_1)} \subset U$ .  $\square$

**Corollary 1.8.** *A countable intersection of dense  $G_\delta$ -sets is a dense  $G_\delta$ -set.*

*Proof of Proposition 1.5.* (1) $\Rightarrow$ (2): Let  $x_0 \in X$  with  $\mathcal{O}(x_0)$  dense in  $X$ . Because  $U$  is open,  $\mathcal{O}(x_0) \cap U \neq \emptyset$ . Then there exists  $n \in \mathbb{Z}$  such that  $T^n x_0 \in U$ . Note that  $TU = U$ , we have  $x_0 \in T^{-n}U = U = T^{-m}U$  for any  $m \in \mathbb{Z}$ . This shows  $\mathcal{O}(x_0) \subset U$  and then  $U$  is dense in  $X$ .

(2) $\Rightarrow$ (3): Define  $\tilde{U} = \bigcup_{n \in \mathbb{Z}} T^n U$ . We note that  $T\tilde{U} = \tilde{U}$  is non-empty and open. Then it is dense. Because  $V$  is open,  $\tilde{U} \cap V \neq \emptyset$  and then there exists  $n \in \mathbb{Z}$  such that  $T^n U \cap V \neq \emptyset$ .

(3) $\Rightarrow$ (4): For any  $n \in \mathbb{N}$ ,  $\bigcup_{x \in X} B_{\frac{1}{n}}(x)$  is a open cover. Because  $X$  is compact, there exists  $k(n) \in \mathbb{N}$  such that  $\bigcup_{i=1}^{k(n)} B_{\frac{1}{n}}(x_i)$  covers  $X$ . Denote  $B_{\frac{1}{n}}(x_i)$ ,  $i = 1, \dots, k(n)$ ,  $n \in \mathbb{N}$  by  $O_1, O_2, \dots$ . To show density of a set, it suffices to show that the set intersects any of those open sets  $O_1, O_2, \dots$ . For any  $j \in \mathbb{N}$ , we define  $\tilde{O}_j = \bigcup_{n \in \mathbb{Z}} T^n O_j$ . By assumption,  $\tilde{O}_j$  intersects any other open set. This means  $\tilde{O}_j$  is dense. By Baire Category Theorem,  $G := \bigcap_{j=1}^{\infty} \tilde{O}_j$  is a dense  $G_\delta$ -set and consists precisely of all points  $x_0 \in X$  with dense orbit. To see that, if  $x_0$  has dense orbit,  $\mathcal{O}(x_0)$  must intersect all open set  $O_1, O_2, \dots$ . Then for any  $O_i$ , there is  $n \in \mathbb{Z}$  such that  $T^n x_0 \in O_i$ . Thus  $x_0 \in \tilde{O}_i$  and then  $x_0 \in G$ . Conversely, for any  $x_0 \in G$ ,  $\mathcal{O}(x_0)$  intersects open balls with any small radius. Thus it is dense.

(4) $\Rightarrow$ (1): Dense set can not be empty.  $\square$

**Definition 1.9.** *A homeomorphism  $T: X \rightarrow X$  is called topological mixing if for any two non-empty open sets  $U, V \subset X$ , there exists  $N$  such that  $T^n U \cap V \neq \emptyset$  for all  $n \in \mathbb{Z}$  with  $|n| > N$ .*

**Definition 1.10.** *A homeomorphism  $T: X \rightarrow X$  is called minimal if every orbit is dense.*

**Proposition 1.11.** *Let  $T: X \rightarrow X$  be a homeomorphism of a compact metric space  $X$ . The followings are equivalent:*

1.  $T$  is minimal;
2. if  $E = TE \subset X$  is closed, then either  $E = \emptyset$  or  $E = X$ ;
3. if  $U \subset X$  is open and non-empty, then  $\bigcup_{n \in \mathbb{Z}} T^n U = X$ .

*Proof.* (1) $\Rightarrow$ (2): Suppose  $x \in E$ . We have  $X = \overline{\mathcal{O}(x)} \subset \overline{E} = E$ .

(2) $\Rightarrow$ (3): Denote  $\tilde{U} = \bigcup_{n \in \mathbb{Z}} T^n U$ .  $\tilde{U}$  is open and  $T\tilde{U} = \tilde{U}$ . Hence  $E := X - \tilde{U}$  is closed and  $TE = E$ . Then we have  $E = \emptyset$ .

(3) $\Rightarrow$ (1): Let  $x_0 \in X$  and  $U \neq \emptyset \subset X$  be open. Then there is  $n \in \mathbb{Z}$  such that  $x_0 \in T^n U$ . This shows that  $\mathcal{O}(x_0)$  intersects any non-empty open subset of  $X$ . Hence it is dense.  $\square$

**Theorem 1.12.** *Let  $X$  be a compact metric space and  $T: X \rightarrow X$  be a homeomorphism. Then there exists a closed non-empty subset  $Y \subset X$  so that  $Y = TY$  and  $T|_Y: Y \rightarrow Y$  is minimal.*

*Proof.* Define

$$\mathcal{E} := \{Y \subset X : Y \neq \emptyset, Y \text{ closed}, TY = Y\} \ni X.$$

We want to use Zorn's Lemma under  $\subset$ . We need to show that any chain in  $\mathcal{E}$  has a lower bound in  $\mathcal{E}$ . Let  $(Y_\alpha : \alpha \in \mathcal{I})$  be a chain. Define  $Y = \bigcap_{\alpha \in \mathcal{I}} Y_\alpha$ . Clearly,  $TY = Y$  and  $Y$  is closed. Note that any intersection of finite  $Y_\alpha$  is non-empty, by compactness of  $X$ ,  $Y \neq \emptyset$ . These show that  $Y$  is the lower bound of chain  $(Y_\alpha : \alpha \in \mathcal{I})$ .

By Zorn's Lemma, there is a minimal element  $Y \in \mathcal{E}$ . Then  $T|_Y: Y \rightarrow Y$  is minimal by Proposition 1.11.  $\square$

**Corollary 1.13.** *There exists  $x_0 \in X$  so that  $T^{n_k} x_0 \rightarrow x_0$  as  $k \rightarrow \infty$  for some  $n_k \nearrow \infty$ .*

*Proof.* Let  $Y \subset X$  be as in Theorem 1.12 and  $x_0 \in Y$  be arbitrary. We have  $\omega^+(x_0) \subset Y$  and  $\omega^+(x_0)$  is  $T$ -invariant closed set. Note that  $T|_Y: Y \rightarrow Y$  is minimal, by Proposition 1.11,  $\omega^+(x_0) = \emptyset$  or  $Y$ . Note again that  $Y$  is a closed subset of the compact space  $X$ , it is also compact. Hence  $\omega^+(x_0) \neq \emptyset$ . This shows that  $x_0 \in Y = \omega^+(x_0)$ .  $\square$

**Definition 1.14.**  $x_0 \in X$  is called recurrent for  $T: X \rightarrow X$  if  $x_0 \in \omega_T^+(x_0)$ .

**Example 1.15.** Let  $\alpha \notin \mathbb{Q}$  and  $R: \mathbb{T} \rightarrow \mathbb{T}$  which maps  $x$  to  $x + \alpha$ . Then  $R$  is minimal: by 1.13, there is  $x_0 \in \mathbb{T}$  which is recurrent. Let  $\varepsilon > 0$ . There is  $n \in \mathbb{N}$  such that  $\varepsilon > d(R^n x_0, x_0) = d(x_0 + n\alpha, x_0) = d(n\alpha, 0)$ . Note that  $n\alpha \neq 0$  in  $\mathbb{T}$ . For any  $x \in \mathbb{T}$ ,  $x, x \pm n\alpha, x \pm 2n\alpha, \dots, x \pm \left\lfloor \frac{1}{d(n\alpha, 0)} \right\rfloor n\alpha \in \mathcal{O}(x)$  is  $\varepsilon$ -dense in  $\mathbb{T}$ . This shows every orbit is dense.

**Definition 1.16.** Let  $T: X \rightarrow X$  be a homeomorphism. We say  $T$  is expansive if there exists (the expansive constant)  $\delta > 0$  so that for any  $x \neq y \in X$ , there exists  $n \in \mathbb{Z}$  so that  $d(T^n x, T^n y) \geq \delta$ .

**Example 1.17.**  $T_A: \mathbb{T}^2 \rightarrow \mathbb{T}^2$  given by matrix multiplication defined by  $A = \begin{pmatrix} 0 & 1 \\ 1 & 1 \end{pmatrix}$  is expansive, topological transitive, mixing and not minimal.

**Theorem 1.18** (Multiple Recurrence Theorem). *Let  $X$  be a compact metric space and let  $T_1, \dots, T_d: X \rightarrow X$  be pairwise commutative homeomorphisms. Then there exists some  $x_0 \in X$  and some  $n_k \nearrow \infty$  as  $k \rightarrow \infty$  so that  $T_j^{n_k} x_0 \rightarrow x_0$  for  $j = 1, \dots, d$ .*

*Proof.* We will use induction. For  $d = 1$ , Corollary 1.13 works. Now we assume the theorem holds for  $d - 1$ . And we also assume  $X$  is  $d$ -minimal in the sense that  $Y \subset X$  closed and  $Y = T_1 Y = \dots = T_d Y$  imply  $Y = \emptyset$  or  $X$ . This can be done by reapplying the proof of Theorem 1.12.

Denote

$$S = T_1 \times \dots \times T_d: X^d \rightarrow X^d,$$

$$\widehat{T_j} = T_j \times \dots \times T_j: X^d \rightarrow X^d.$$

$S, \widehat{T_1}, \dots, \widehat{T_d}$  are pairwise commutative. For  $\underline{n} = (n_1, \dots, n_d) \in \mathbb{Z}^d$ , we define

$$T^{\underline{n}} = T_1^{n_1} \circ \dots \circ T_d^{n_d}: X \rightarrow X,$$

$$\widehat{T}^{\underline{n}} = \widehat{T_1}^{n_1} \circ \dots \circ \widehat{T_d}^{n_d}: X^d \rightarrow X^d.$$

Denote  $\Delta(x) = (x, \dots, x)$  the diagonal element in  $X^d$  and  $\Delta_X = \{\Delta(x) : x \in X\}$ . By commutativity,  $\widehat{T}^{\underline{n}}(\Delta(x)) = \Delta(T^{\underline{n}}x)$ . We need to prove that there exist some  $x_0 \in X$  and  $n_k \nearrow \infty$  such that  $S^{n_k}(\Delta(x_0)) \rightarrow \Delta(x_0)$  as  $k \rightarrow \infty$ .

**Claim (A).**  $\Delta_X \cap \omega_S^+(\Delta_X) \neq \emptyset$ , where for the subset  $\Delta_X \subset X$ , we define  $\omega_S^+(\Delta_X) = \{\lim_{k \rightarrow \infty} S^{n_k}(\Delta(y_k)) : \Delta(y_k) \in \Delta_X, n_k \nearrow \infty\}$ .

*Proof of Claim (A).* Denote

$$R_1 = T_1 T_d^{-1}, \dots, R_{d-1} = T_{d-1} T_d^{-1}: X \rightarrow X.$$

By inductive hypothesis, there exists  $x_0 \in X$  and  $n_k \nearrow \infty$  so that  $R_j^{n_k} x_0 \rightarrow x_0$  as  $k \rightarrow \infty$  for all  $j = 1, \dots, d - 1$ . Define  $y_k = T_d^{n_k} x_0$ . For  $j < d$ ,  $T_j^{n_k} y_k = R_j^{n_k} x_0 \rightarrow x_0$ ; for  $j = d$ ,  $T_d^{n_k} y_k = x_0$ , as  $k \rightarrow \infty$ . This means  $\Delta(x_0) = \lim_{k \rightarrow \infty} S^{n_k}(\Delta(y_k)) \in \Delta_X \cap \omega_S^+(\Delta_X) \neq \emptyset$ .  $\square$

**Claim (B).**  $\Delta_X \subset \omega_S^+(\Delta_X)$ .

*Proof of Claim (B).* This proof needs the minimality assumption. Denote  $Y = \{x \in X : \Delta(x) \in \omega_S^+(\Delta_X)\}$ . Because  $[x \mapsto \Delta(x)]$  is continuous and  $\omega_S^+(\Delta_X)$  is closed by diagonal principle,  $Y$  is closed. By Claim (A),  $Y \neq \emptyset$ . By Proposition 1.11, we only need to prove that  $T_j^{\pm 1} Y \subset Y$  for  $j = 1, \dots, d$ , then  $Y = X$  and the claim follows.

Let  $x \in Y$ . Then there exists  $n_k \nearrow \infty$  and  $y_k \in X$  such that  $\Delta(x) = \lim_{k \rightarrow \infty} S^{n_k}(\Delta(y_k))$ . Hence we have

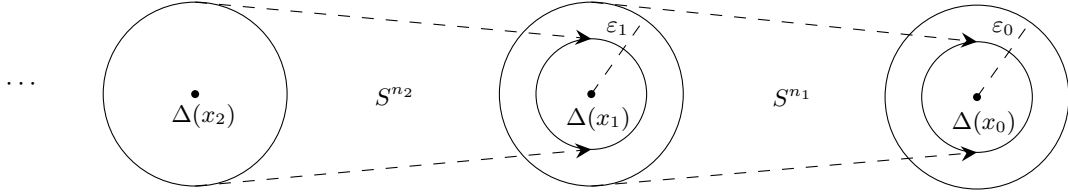

$$\Delta(T_j^{\pm 1} x) = \widehat{T_j}^{\pm 1}(\Delta(x)) = \lim_{k \rightarrow \infty} \widehat{T_j}^{\pm 1} S^{n_k}(\Delta(y_k)) = \lim_{k \rightarrow \infty} S^{n_k} \Delta(T_j^{\pm 1} y_k) \in \omega_S^+(\Delta_X).$$

This shows  $T_j^{\pm 1} x \in Y$ .  $\square$

**Claim (C).** For every  $\varepsilon > 0$ , there exists a point  $x \in X$  and some  $n \geq 1$  so that  $d(S^n(\Delta(x)), \Delta(x)) < \varepsilon$ .

*Proof of Claim (C).* Let  $x_0 \in X$  be arbitrary and  $\varepsilon_0 \in (0, \frac{\varepsilon}{2})$ . By Claim (B), there exists  $x_1 \in X$ ,  $n_1 \geq 1$  so that  $d(S^{n_1}(\Delta(x_1)), \Delta(x_0)) < \varepsilon_0$ . By continuity of  $S^{n_1}$  there exists  $\varepsilon_1 \in (0, \varepsilon_0)$  so that if  $y = (y_1, \dots, y_d) \in B_{\varepsilon_1}(\Delta(x_1))$ , then  $S^{n_1}(y) \in B_{\varepsilon_0}(\Delta(x_0))$ .

Continuing inductively we find new points  $x_k \in X$  and  $n_k \geq 1$  so that  $d(S^{n_k}(\Delta(x_k)), \Delta(x_{k-1})) \leq \varepsilon_{k-1}$ , where  $\varepsilon_k \in (0, \varepsilon_{k-1})$  so that if  $y = (y_1, \dots, y_d) \in B_{\varepsilon_k}(\Delta(x_k))$ , then  $S^{n_k}(y) \in B_{\varepsilon_{k-1}}(\Delta(x_{k-1}))$ .

By compactness of  $X$ , we can find  $0 \leq k < l$  so that  $d(\Delta(x_k), \Delta(x_l)) < \frac{\varepsilon}{2}$ . Applying  $S^{n_l}$  to  $\Delta(x_l)$ , we obtain a point in  $B_{\varepsilon_{l-1}}(\Delta(x_{l-1}))$ . By construction, note that  $S^{n_l}(\Delta(x_l)) \in B_{\varepsilon_{l-1}}(\Delta(x_{l-1}))$ , we obtain  $S^{n_{l-1}+n_l}(\Delta(x_l)) \in B_{\varepsilon_{l-2}}(\Delta(x_{l-2}))$ . Continuing inductively, we obtain  $S^{n_{k+1}+\dots+n_l}(\Delta(x_l)) \in B_{\varepsilon_k}(\Delta(x_k))$ . Then  $n = n_{k+1} + \dots + n_l$  and  $x = x_l$  are as desired:

$$d(S^{n_{k+1}+\dots+n_l}(\Delta(x_l)), \Delta(x_l)) \leq d(S^{n_{k+1}+\dots+n_l}(\Delta(x_l)), \Delta(x_k)) + d(\Delta(x_k), \Delta(x_l)) < \varepsilon_k + \frac{\varepsilon}{2} < \varepsilon.$$

□

We define

$$F(x) = \inf_{n \in \mathbb{N}} d(S^n(\Delta(x)), \Delta(x)).$$

**Claim (D).** If there exists  $x_0 \in X$  such that  $F(x_0) = 0$ , then the theorem also holds for  $d$  maps. Thus the proof will be completed.

*Proof of Claim (D).* If there exists  $n$  so that  $d(S^n(\Delta(x)), \Delta(x)) = 0$ , then for  $n_k = nk$ , we have  $\Delta^{n_k}(\Delta(x_0)) = \Delta(x_0) \rightarrow \Delta(x_0)$ . If not, there exists  $n_k$  with  $S^{n_k}(\Delta(x_0)) \rightarrow \Delta(x_0)$ . □

To prove the existence of such  $x_0 \in X$ , we need a lemma:

**Lemma 1.19.** Let  $X$  be a compact metric space. Let  $f_n: X \rightarrow [0, \infty)$  be a sequence of continuous. We define  $F(x) = \inf_{n \in \mathbb{N}} f_n(x)$  for any  $x \in X$ .

1.  $F$  is upper semi-continuous: for any  $x \in X$  and  $\varepsilon > 0$ , there exists some  $\delta > 0$  so that for any  $y \in B_\delta(x)$ , we have  $F(y) < F(x) + \varepsilon$ .

2. The sets

$$\mathcal{J}_\varepsilon := \left\{ x \in X : \forall \eta > 0, \sup_{y, z \in B_\eta(x)} |F(y) - F(z)| > \varepsilon \right\}$$

are closed with empty interior for all  $\varepsilon > 0$ .

3.  $F$  is continuous on a dense  $G_\delta$ -set in  $X$ .

*Proof of Lemma 1.19.* (1): By definition, there is some  $n$  so that  $f_n(x) < F(x) + \frac{\varepsilon}{2}$ . Because  $f_n$  is continuous, there exists  $\delta > 0$  so that for any  $y \in B_\delta(x)$ ,  $f_n(y) < f_n(x) + \frac{\varepsilon}{2}$ . Now we have

$$F(y) \leq f_n(y) < f_n(x) + \frac{\varepsilon}{2} < F(x) + \varepsilon.$$

(2): Let  $\bar{x} \in \overline{\mathcal{J}_\varepsilon}$ . Let  $\eta > 0$ . Then there exists  $x \in \mathcal{J}_\varepsilon \cap B_{\frac{\eta}{2}}(\bar{x})$ . By triangle inequality,  $B_{\frac{\eta}{2}}(x) \subset B_\eta(\bar{x})$ . Thus by definition,

$$\sup_{y, z \in B_\eta(\bar{x})} |F(y) - F(z)| \geq \sup_{y, z \in B_{\frac{\eta}{2}}(x)} |F(y) - F(z)| > \varepsilon.$$

This implies  $\bar{x} \in \mathcal{J}_\varepsilon$  and then  $\mathcal{J}_\varepsilon$  is closed.

Suppose there exists some  $x_0 \in \mathcal{J}_\varepsilon^\circ$ . By (1), there is a  $\delta_0 > 0$  so that  $F(y) < F(x_0) + \frac{\varepsilon}{2}$  for all  $y \in B_{\delta_0}(x_0)$ . We choose  $\delta_0$  small enough such that  $B_{\delta_0}(x_0) \subset \mathcal{J}_\varepsilon$ . We claim that we can find a point  $x_1 \in B_{\delta_0}(x_0)$  such that  $F(x_1) \leq F(x_0) - \frac{\varepsilon}{2}$ . If not, for any  $y \in B_{\delta_0}(x_0)$ ,  $F(y) > F(x_0) - \frac{\varepsilon}{2}$ . Associating our choice of  $\delta_0$ ,  $|F(y) - F(x_0)| < \frac{\varepsilon}{2}$ . Then for any  $y, z \in B_{\delta_0}(x_0)$ ,  $|F(y) - F(z)| \leq |F(y) - F(x_0)| + |F(x_0) - F(z)| < \varepsilon$ . This gives a contradiction of the definition of  $\mathcal{J}_\varepsilon$ . Now we can repeat this to find  $B_{\delta_1}(x_1) \subset B_{\delta_0} \subset \mathcal{J}_\varepsilon$  and

$x_2 \in B_{\delta_1}(x_1)$  such that  $F(x_2) \leq F(x_1) - \frac{\varepsilon}{2} \leq F(x_0) - 2 \cdot \frac{\varepsilon}{2}$ . Repeating this process, we get a sequence  $x_n \in B_{\delta_0}(x_0)$  so that  $F(x_n) \leq F(x_0) - n \cdot \frac{\varepsilon}{2}$ . This contradicts to the fact that  $F \geq 0$ .

(3): By (2),  $X - \mathcal{J}_{\frac{1}{n}}$  is open and dense. Thus by Baire Category Theorem,  $G := \bigcap_{n \geq 0} (X - \mathcal{J}_{\frac{1}{n}})$  is a dense  $G_\delta$ -set. Fix  $x \in G$ . For any  $\varepsilon > 0$ , choose  $n$  such that  $\frac{1}{n} < \varepsilon$ . By construction,  $x \notin \mathcal{J}_{\frac{1}{n}}$ , i.e. there exists  $\eta > 0$  so that  $\sup_{y, z \in B_\eta(x)} |F(y) - F(z)| < \frac{1}{n} < \varepsilon$ . In particular,  $|F(y) - F(x)| < \varepsilon$  for all  $y \in B_\eta(x)$ . Hence  $F$  is continuous at  $x$ .  $\square$

Especially, we have

**Claim (E).** There exists  $x_0 \in X$  so that  $F$  is continuous at  $x_0$ .

**Claim (F).** If  $F$  is continuous at  $x_0$ , then  $F(x_0) = 0$ .

*Proof of Claim (F).* Assume  $F(x_0) > 0$ . Then there is an open neighborhood  $U$  of  $x_0$  and  $\delta > 0$  such that  $F(x) > \delta > 0$  in  $U$ . Note that  $\tilde{U} := \bigcup_{\underline{n} \in \mathbb{Z}^d} T^{-\underline{n}}U$  is non-empty and open, and  $T_1\tilde{U} = \dots = T_d\tilde{U} = \tilde{U}$ . By minimality and Proposition 1.11, considering the closed set  $Y = X - \tilde{U}$ , we obtain  $\tilde{U} = X$ . By compactness, there is a finite set  $F \subset \mathbb{Z}^d$  such that  $X = \bigcup_{\underline{n} \in F} T^{-\underline{n}}U$ . By continuity of  $\hat{T}^{\underline{n}}$  for  $\underline{n} \in F$  and compactness of  $X$ ,  $\hat{T}^{\underline{n}}$  is uniform continuous on  $X$ . And because  $F$  is finite, there exists some  $\varepsilon > 0$  so that for all  $x, y \in X^d$ ,  $d(x, y) < \varepsilon$ , we have  $d(\hat{T}^{\underline{n}}x, \hat{T}^{\underline{n}}y) < \delta$ , for any  $\underline{n} \in F$ .

By Claim (C), for this  $\varepsilon > 0$ , we can find an  $x_\varepsilon \in X$  with  $F(x) < \varepsilon$ . Especially, we can also find an  $m \geq 1$  so that  $d(S^m(\Delta(x_\varepsilon)), \Delta(x_\varepsilon)) < \varepsilon$ . Besides, we can find an  $\underline{n} \in F$  so that  $x_\varepsilon \in T^{-\underline{n}}U$ . Now by continuity of  $\hat{T}^{\underline{n}}$  and commutativity of the maps, we have

$$\delta > d(\hat{T}^{\underline{n}}(S^m(\Delta(x_\varepsilon))), \hat{T}^{\underline{n}}(\Delta(x_\varepsilon))) = d(S^m(\Delta(T^{\underline{n}}(x_\varepsilon))), \Delta(T^{\underline{n}}(x_\varepsilon)))$$

for  $T^{\underline{n}}(x_\varepsilon) \in U$ . Recall that  $F > \delta$  on  $U$ . We get a contradiction.  $\square$

$\square$

**Remark 1.20.** If  $T_j$  are not commutative, it fails. For example, consider the North-South dynamics and “East-West” dynamics on  $\mathbb{S}^1$ .

As corollary, we have:

**Theorem 1.21** (van der Werden). *Let  $\mathbb{Z} = B_1 \sqcup B_2 \sqcup \dots \sqcup B_k$  be a finite partition. Then there exists  $B = B_j$  such that it contains arbitrarily long arithmetic progressions: for arbitrary  $N$ , there exist some  $a, d \in \mathbb{Z}$  such that*

$$a, a + d, a + 2d, \dots, a + Nd \in B$$

*Proof.* To prove this theorem, we need to construct a related dynamical system.

Let  $X_{full} = \{1, \dots, k\}^{\mathbb{Z}}$ . The full shift is defined as  $\sigma: X_{full} \rightarrow X_{full}$ ,  $(\sigma(x))_n = x_{n+1}$ .

We can define a metric on  $X_{full}$ :

$$d(x, y) := \begin{cases} 0, & x = y; \\ \frac{1}{n+1}, & n = \min\{|k| : x_k \neq y_k\} \end{cases}.$$

**Claim.**  $X_{full}$  is compact under this metric.

*Proof of Claim.* Note that  $d$  induces the standard product topology. Then Tychonoff’s Theorem gives the claim.  $\square$

Now we turn to famous Furstenberg’s correspondence. We define  $z \in X_{full}$  by  $z_n = j$  if  $n \in B_j$  and then  $X := \overline{\mathcal{O}_\sigma(z)} \subset X_{full}$ . Consider the shift map  $\sigma = \sigma|_X: X \rightarrow X$ . Note that  $X$  is closed in a compact space, it’s compact. Hence  $\sigma$  is a homeomorphism on a compact metric space  $X$ . Moreover, we define  $T_1 = \sigma, \dots, T_N = \sigma^N$ .

By multiple recurrence theorem, there exists some  $x \in X$  and some  $n_l \nearrow \infty$  such that  $T_1^{n_l}x \rightarrow x, \dots, T_N^{n_l}x \rightarrow x$ , i.e.  $\sigma^{n_l}x \rightarrow x, \dots, \sigma^{Nn_l}x \rightarrow x$  as  $l \rightarrow \infty$ . Then for  $\varepsilon = 1$ , we can find an  $n_l$  such that  $d(\sigma^{n_l}x, x) < 1, \dots, d(\sigma^{Nn_l}x, x) < 1$ . Denote  $d = n_l$ . By definition, this happens if and only if  $x_d = x_0, \dots, x_{Nd} = x_0$ .

Now we work with the facts that  $x_0 = x_d = \cdots = x_{Nd}$  and  $x \in X = \overline{\mathcal{O}_\sigma(z)}$ . There exists some  $a \in \mathbb{Z}$  such that  $d(x, \sigma^a z) < \frac{1}{Nd+1}$ . By definition,  $x$  and  $\sigma^a z$  have the same symbols at coordinates  $-Nd, \dots, 0, \dots, Nd$ . Therefore,

$$\begin{array}{ccccccc} x_0 & \equiv & x_d & \equiv & \cdots & \equiv & x_{Nd} \\ \parallel & & \parallel & & \parallel & & \parallel \\ z_a & & z_{a+d} & & \cdots & & z_{a+Nd} \end{array}$$

This forces,

$$\begin{array}{ccccccc} x_0 & \equiv & x_d & \equiv & \cdots & \equiv & x_{Nd} \\ \parallel & & \parallel & & \parallel & & \parallel \\ z_a & \equiv & z_{a+d} & \equiv & \cdots & \equiv & z_{a+Nd} \equiv j \end{array}$$

for a  $j \in \{1, \dots, k\}$ . Hence  $a, a+d, \dots, a+Nd \in B_j$ , which are as desired.

□
